

TABLE TRACKER™

For Fast Casual Restaurants

IT'S LIKE GPS FOR
YOUR FOOD RUNNERS

THE FASTEST WAY TO DELIVER FOOD

Table Tracker, the LRS patented system, helps runners deliver food orders faster. The device wirelessly senses the exact table number each order should be delivered to. Runners no longer have to search the restaurant while the customer's food gets cold.

Table Tracker is about the size of a CD and less than half an inch thick. It doesn't take up any valuable table space because it uses RFID tags installed under the table. In fact, the sensors aren't visible to your guests.

INVENTORY ACCOUNTABILITY

When the Table Tracker is handed to the customer, it sends a signal to the touch screen display which shows the order number. The only way to remove an order number from the touch screen is by returning the Table Tracker to the kitchen. If the device is not returned, the manager will be notified within minutes. Full equipment inventory reports are available online.

PERFORMANCE REPORTS

Delivering food quickly and at the correct temperature is critical to the success of any restaurant. With Table Tracker, online reports are available to show these delivery times. Reports can be accessed by managers or the corporate office.

Reduce Food Runners

Deliver Food Faster & On Time

Deliver Food at Proper Temps

Eliminate Table Tents

HOW IT WORKS:

- 1. Your guest places their order and is handed a Table Tracker**
- 2. They select a table and place the Table Tracker anywhere on the table**
- 3. Table Tracker sends table information back to the kitchen touch screen**
- 4. When the order is ready, the runner checks the screen and knows exactly where to deliver the food**
